

## SAVINGS WITH ELECTRONIC SCALES IN NUMBERS

How long does one weighing of 100 chicks take?

■ **1. With MECHANICAL SCALE** **takes 35 minutes**

- The weighing takes 15 min., but two people are needed for the job – one weighs, the other writes down the results. 2 x 15 min. = 30 min.
- Calculating the required statistics takes another 5 minutes.

■ **2. With ELECTRONIC MANUAL SCALE BAT1** **takes 15 minutes**

- Only one person can do the job comfortably because the scale stores results automatically.
- The statistics are calculated automatically.

■ **3. With ELECTRONIC AUTOMATIC SCALE BAT2** **takes 0 minutes**

- No staff is needed either for the weighing or for calculating the statistics.
- Everything is done automatically. And you get the statistics every day.

That makes savings of 20 minutes with BAT1 and 35 minutes with BAT2 on only one weighing.

! Considering a weekly weighing on a farm with 10 houses you will get these savings:

Number of weighing	Savings with manual scale BAT1	Savings with automatic scale BAT2
1 weighing on a whole farm	200 min. / €33.3	350 min. / €58.3
weekly weighing in 1 year	<b>€1 732</b>	<b>€3 032</b>
weekly weighing in 5 years	<b>€8 660</b>	<b>€15 160</b>
weekly weighing in 10 years	<b>€17 320</b>	<b>€30 320</b>

Note: Calculated on a salary of €10 / 1 hour.

These significant savings come solely from working time reductions. Consider other benefits related to decision-making and planning based on valuable and precise information obtained by electronic weighing.
